

### Task 1: Knapsack Problem

Write a function `int Knapsack(int W, int[] weights, int[] values)` in C# that determines the maximum value of items that can fit into a knapsack with a capacity `W`. The function should handle up to 100 items. Find the optimal way to fill the knapsack with the given items to achieve the maximum total value. You must consider that you cannot break items, but have to include them whole.

```
public class Knapsack {

    public static int knapsack(int W, int[] weights, int[] values) {

        int n = weights.length;

        int[][] dp = new int[n + 1][W + 1];

        for (int i = 0; i <= n; i++) {

            for (int w = 0; w <= W; w++) {

                if (i == 0 || w == 0) {

                    dp[i][w] = 0;

                } else if (weights[i - 1] <= w) {

                    dp[i][w] = Math.max(values[i - 1] + dp[i - 1][w - weights[i - 1]], dp[i - 1][w]);

                } else {

                    dp[i][w] = dp[i - 1][w];

                }

            }

        }

        return dp[n][W];

    }

    public static void main(String[] args) {
```

```

int W = 40;

int[] weights = { 10, 20, 30 };

int[] values = { 60, 100, 120 };

System.out.println("Maximum value in Knapsack = " + knapsack(W, weights, values));

}

}

```

## Task 2: Longest Common Subsequence

**Implement** `int LCS(string text1, string text2)` **to find the length of the longest common subsequence between two strings.**

```

public class LongestCommonSubsequence {

    public static int lcs(String text1, String text2) {

        int m = text1.length();

        int n = text2.length();

        int[][] dp = new int[m + 1][n + 1];

        for (int i = 1; i <= m; i++) {

            for (int j = 1; j <= n; j++) {

                if (text1.charAt(i - 1) == text2.charAt(j - 1)) {

                    dp[i][j] = dp[i - 1][j - 1] + 1;

                } else {

                    dp[i][j] = Math.max(dp[i - 1][j], dp[i][j - 1]);

                }

            }

        }

    }

}

```

```
        return dp[m][n];  
    }  
}
```

```
public static void main(String[] args) {  
    String text1 = "abcde";  
    String text2 = "ace";  
  
    System.out.println("Length of LCS = " + lcs(text1, text2));  
}  
}
```
